

Circular Motion Study Guide

Name _____

Period _____

I. Rotation vs. Revolution

- Rotation is when an object turns about an _____ axis. Example:
- Revolution is when an object turns about an _____ axis. Example:

II. Tangential vs. Rotational Speed

- The _____ speed is when the object is moving along a circular path. It is _____ angles to the radius. The direction of motion is always _____ to the circle.
- A point on the outer edge moves a _____ distance than a point at the center so the tangential speed is _____ on the outer edge than closer to the axis. $V_t =$ _____ Unit: _____
- The _____ speed is the number of _____ per unit of time. All parts of the object rotate about their axis in the _____ amount of time. Expressed in _____ which stands for revolutions per _____. Other example units would be:

III. Centripetal Force/Acceleration & Centrifugal Force

- The _____ force is any force that causes an object to follow a circular path. It pulls an object out of its straight-line path and into a _____ path. This _____ force is directed at _____ angles to the path of a moving object. $F_c =$ _____ Unit: _____
- _____ acceleration measures how quickly the direction of velocity changes. It can be compared to 9.8 m/s^2 or 1 g . $A_c =$ _____ Unit: _____
- The _____ force is fictitious force. It is actually your own _____ pressing against the outside of the circle.

IV. Center of Gravity is the point located at the object's _____ position of weight.

- An object will remain _____ if the CG is above its base support or supported at that point.
- A block topples when the _____ extends beyond its support base.
- A projectile rotates about its _____.

V. Torque – produces _____. When a force is applied with “_____”.

- Torque = _____ x _____ Unit: _____
- When the force is perpendicular, the distance from the turning axis to the point of contact is called the _____.
- The greater the force or lever arm the greater the _____.
- A pair of torques can _____ each other. $(Fd)_{ccw} = (Fd)_{cw}$
Example: A 60 kg boy sits on a seesaw 1.0 m from the fulcrum. What is the distance from the fulcrum should the 30 kg girl sit in order to balance the seesaw?

VI. Rotational Inertia

- a. Linear inertia (Newton's first law): An object at rest tends to stay at _____, and an object in motion tends to remain _____ in a straight line.
- b. Rotational inertia: An object rotating about an axis tends to keep _____ about that axis, while nonrotating object tends to stay _____.
- c. Just as it takes a force to change linear state of motion, a _____ is required to change the rotational state of motion of an object.
 1. The greater mass on an object, the _____ the rotational inertia.
 2. With rotation on an object, the greater the distance between the axis and the bulk of the mass, the _____ rotational inertia.
 3. A solid cylinder rolls down an incline _____ than a hollow one, of the same mass and diameter.
 4. A hollow cylinder has _____ rotational inertia and the mass will be more "_____ " in gaining speed. So, its acceleration will be _____.
- d. Rotational Inertia and Gymnastics
 1. Extending an arm or leg _____ rotational inertia. (ice skaters)
 2. The rotational inertia is _____ when arms and legs are drawn inward in the tuck position. (somersault or flip)

VII. Angular Momentum = _____ x _____ x _____ Unit: _____

- a. The greater the tangential velocity, _____ its angular momentum.
- b. Law of conservation of momentum - if no unbalanced external torque acts on a rotating system, the angular momentum of the system is _____.

Example: When a person pulls his/her arms and the whirling weights inward, he/she _____ their radius, and their tangential speed correspondingly _____ while _____ angular momentum.
